# Atrial Fibrillation Ablation vs Antiarrhythmic Drugs Trial (A-4 Trial )

- **Multicenter, Unblinded, Randomized Trial**
  - Presented at the 2006 HRS Sessions: Pierre Jais
  - A comparison of catheter ablation with AADs in AF patients who failed at least one AAD
- **Primary Endpoint: Absence of AF (> 3 min)**
- **Enrolled patients:**
  - 112 pts with symptomatic Paroxysmal AF > 6 months
  - Resistant to  $\geq 1$  AADs (Class I or III)
  - At least 2 episodes of AF per month
- **Protocol:**
  - Randomization: Ablation (53 pts) or AADs (59 pts)
  - Crossover from AADs to Ablation at 3 months

# A-4 Trial: Outcome

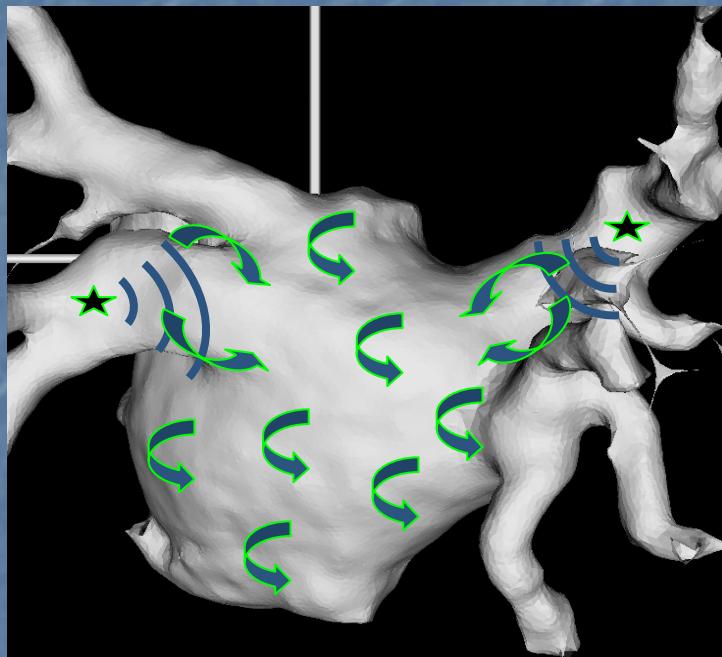

Patients Free of AF at 1 Year

p<0.05

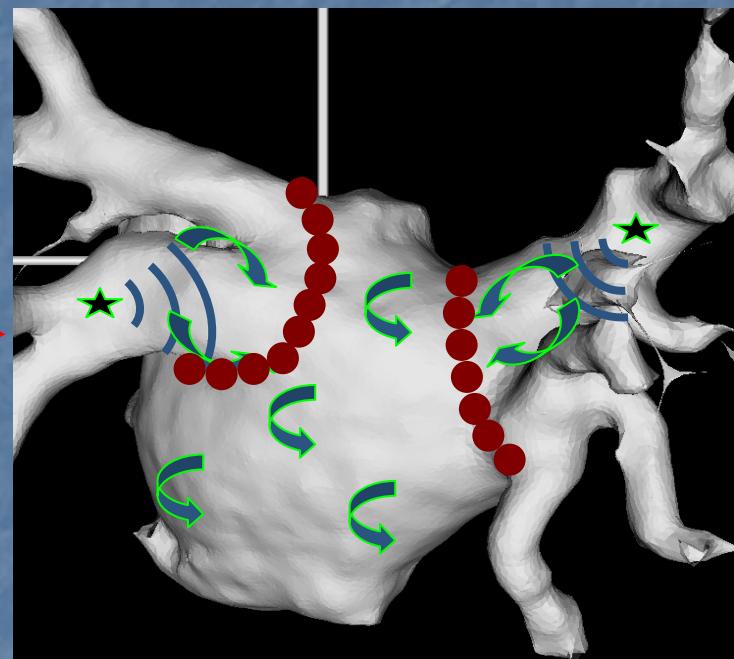

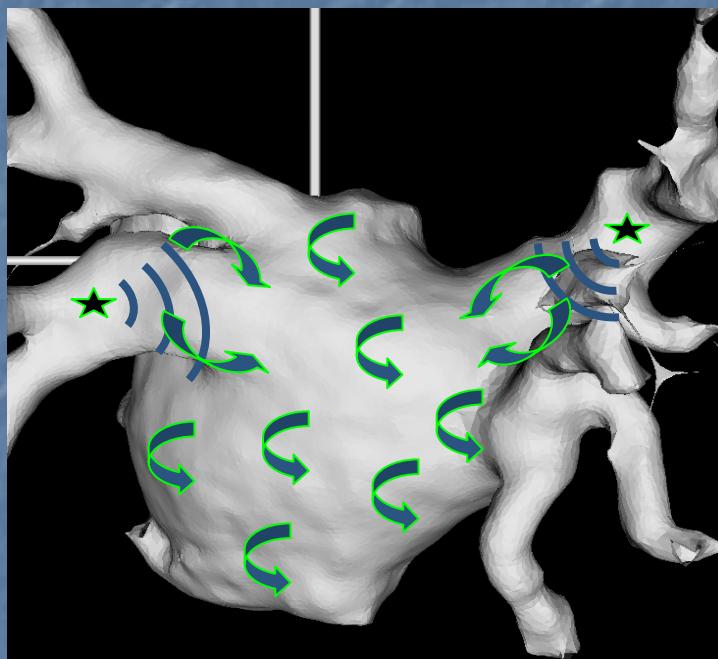

- **Anticoagulation therapy was interrupted in:**
  - Ablation group → 60%
  - AAD group → 25%
- **Quality of life:**
  - 6 of 8 parameters improved in the ablation group
- **Complications:**
  - Ablations in 90 pts
  - 155 procedures → 2 cases of tamponade

## Percentages of Patients without Atrial Fibrillation and Atrial Flutter in the Absence of Antiarrhythmic-Drug Therapy

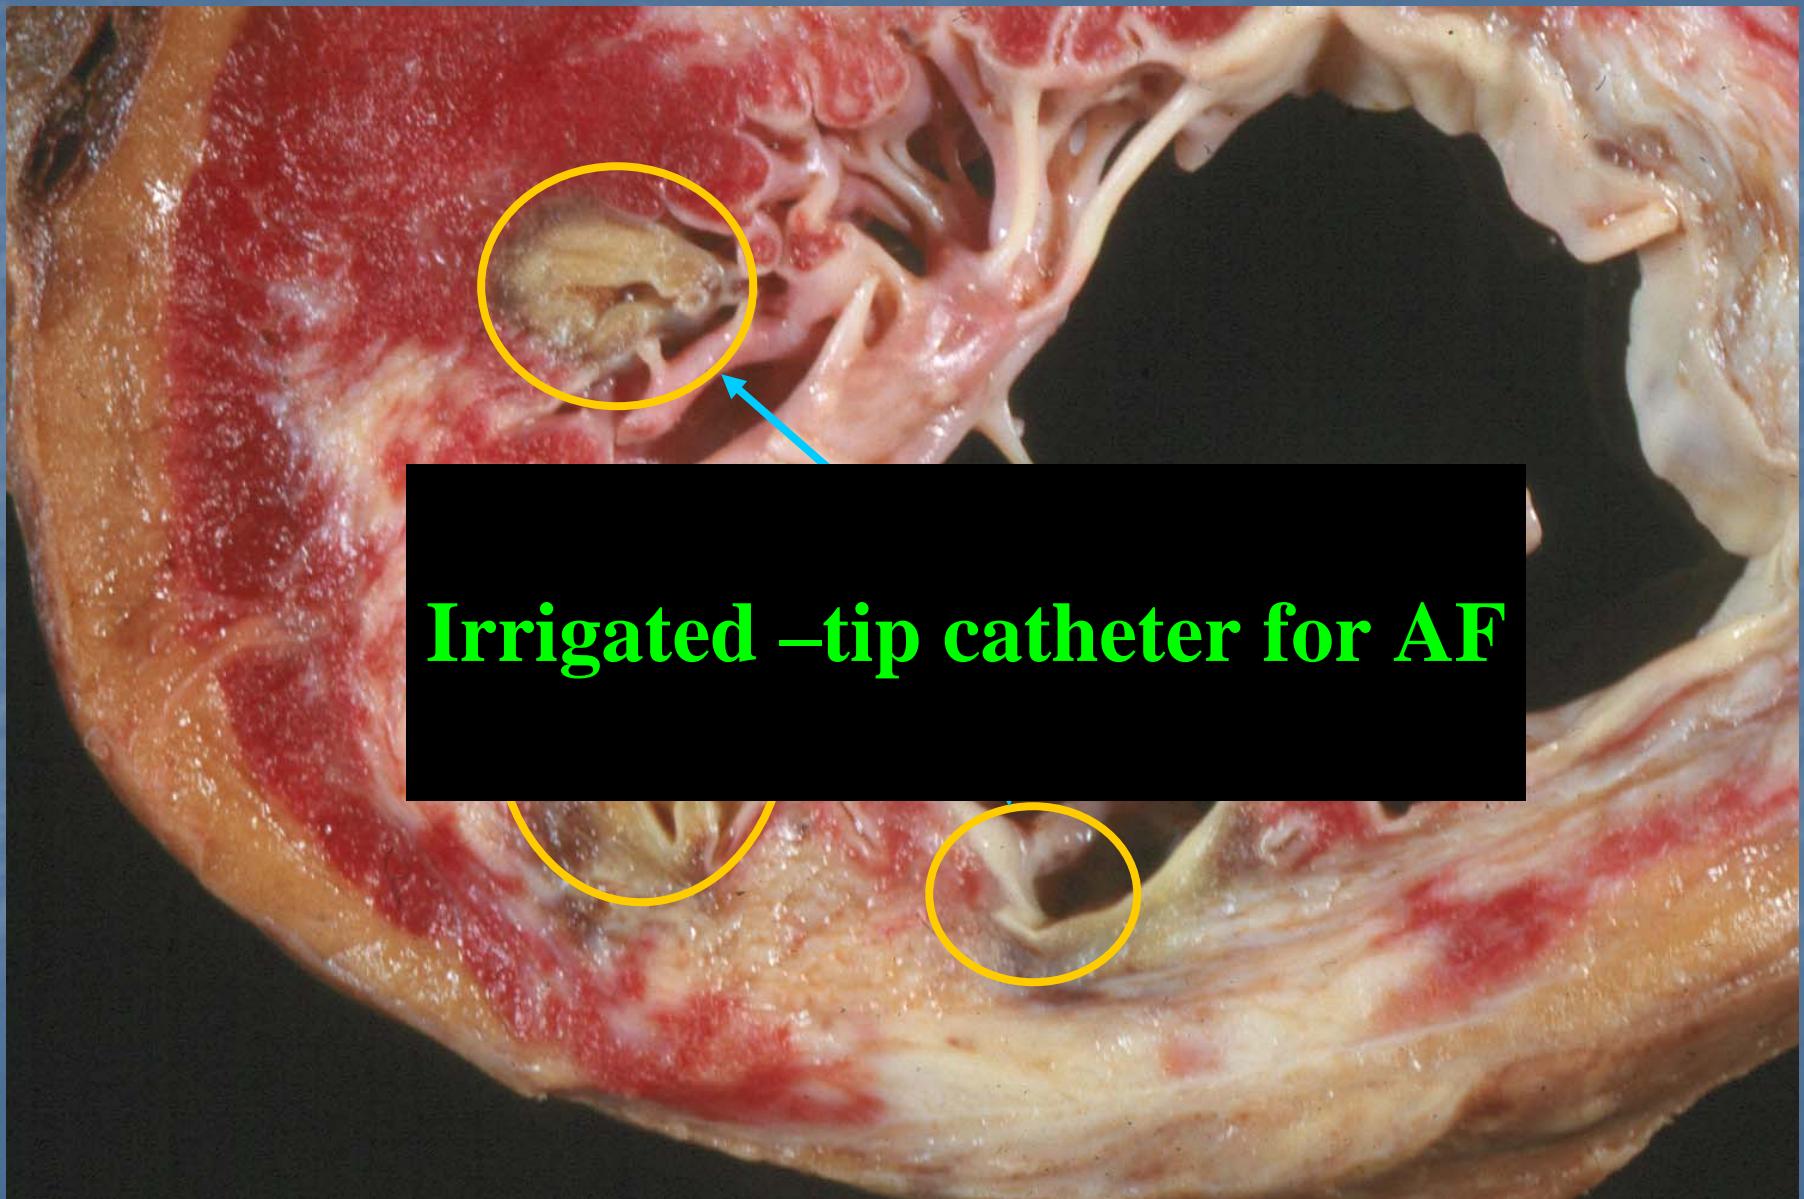

# Catheter Ablation vs. Antiarrhythmic Drug Therapy for Atrial Fibrillation Trial (*CABANA*)

- **Prospective, Unblinded, Randomized-Controlled Trial**
  - A comparison of catheter ablation with medical therapy (rate or rhythm control) in AF patients requiring treatment
- **Endpoint:**
  - Primary: Total mortality
  - Secondary: Composite of Total CV mortality, disabling stroke, serious bleeding and cardiac arrest
- **Inclusion Criteria:**
  - Paroxysmal, Persistent or Permanent AF
  - Risk factor for stroke:
    - Age > 65, HTN, DM, CHF, Prior CVA/TIA, LA > 4.5cm, EF < 35%
- **Protocol:**
  - Randomize 3000 pts to ablation or drug Tx (1:1)
  - Minimum follow-up of 2 years

# Electrode Length

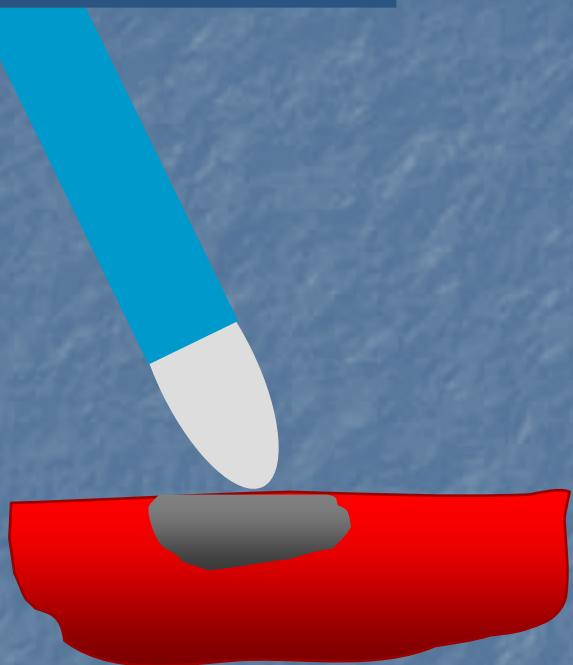

- Increasing electrode tip from 2mm to 4mm results in more than doubling of lesion size, but larger electrodes result in smaller lesions at fixed power (Langberg *PACE* 1990)
- But if increased power used to maintain electrode temp, 8mm tip further doubled lesion depth; 12mm tip made smaller lesions, charring/crater formation seen (Langberg *Circulation* 1993)

# Electrode Contact

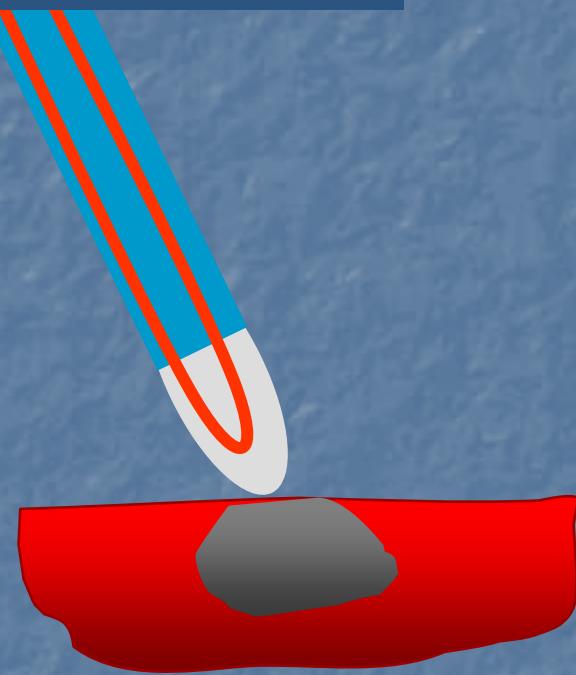

- Better electrode-tissue pressure and contact improves lesion formation (Avitall *PACE* 1997)
- Parallel catheter position produces larger lesions than perpendicular contact (Kongsgaard *PACE* 1997)

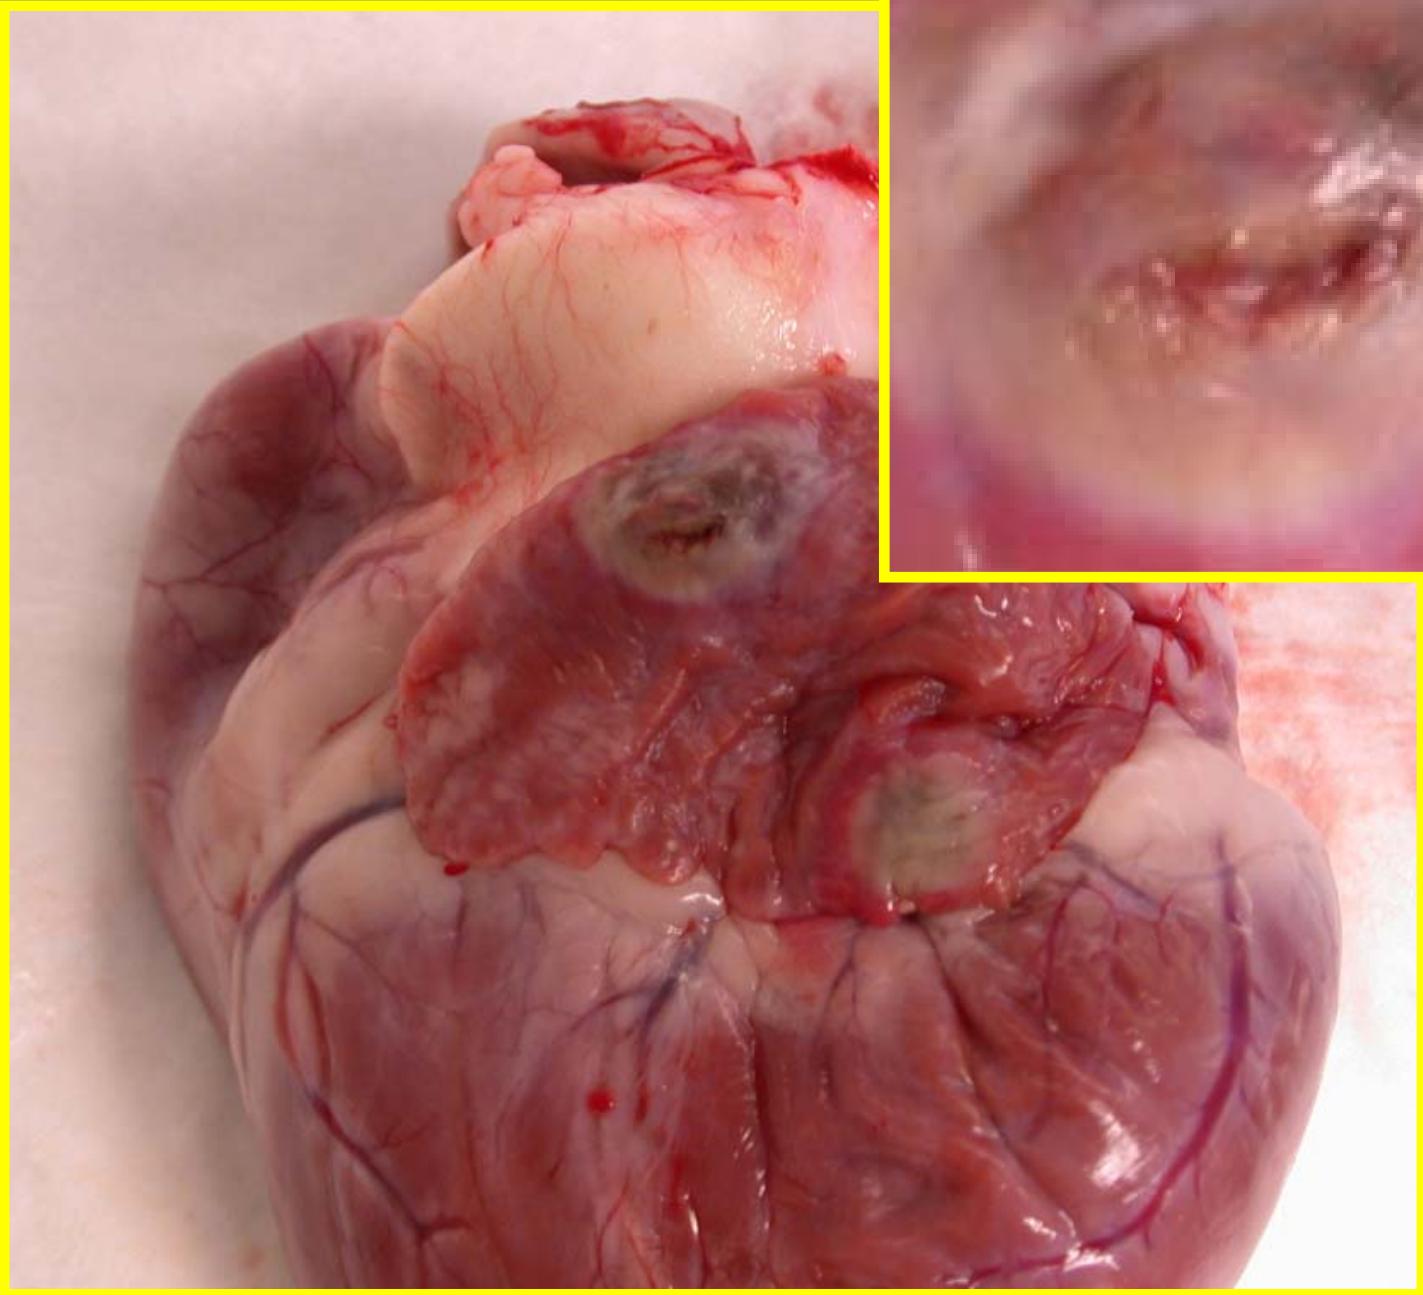

Standard RF  
ablation

Cooled RF  
ablation

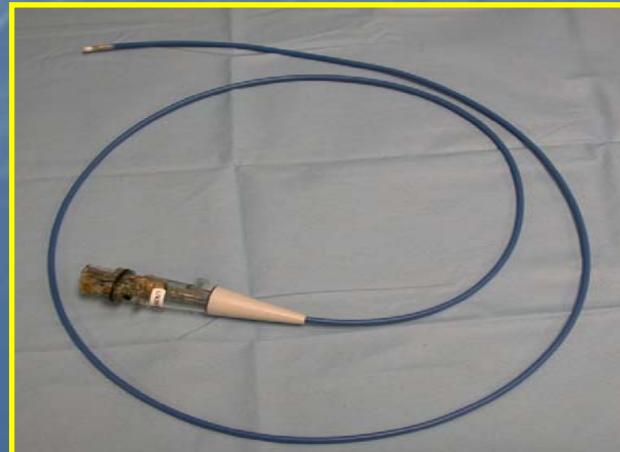

Risks of deeper heating  
greater tissue damage  
intramural “pops”

# Internal irrigation at 36 ml/min

# Intracardiac ultrasound

# Saline irrigated RF ablation

- Markers of steam pops
  - audible pop
  - sudden decrease in temperature
  - sudden catheter movement
  - sudden change in impedance
